1. Terminology

The given terminology is used in this document.

1.1 Abbreviations and Notations

| Abbreviation | Description |
|--------------|---|
| SE | Secure Element |
| API | Application Programming Interface |
| ATR | Answer to Reset (as per ISO/IEC 7816-4) |
| APDU | Application Protocol Data Unit (as per ISO/IEC 7816-4) |
| ISO | International Organization for Standardization |
| ASSD | Advanced Security SD cards (SD memory cards with an embedded security system) as specified by the SD Association. |
| os | Operating system |
| RIL | Radio Interface Layer |
| SFI | Short File ID |
| FID | File ID |
| FCP | File Control Parameters |
| MF | Master File |
| DF | Dedicated File |
| EF | Elementary File |
| OID | Object Identifier |
| PPS | Protocol Parameter Selection (as per ISO/IEC 7816-4) |
| DER | Distinguished Encoding Rules of ASN.1 |
| ASN.1 | Abstract Syntax Notation One |
| DUT | Device under test |
| CMD | The APDU command sent from the DUT |
| RESP | The APDU response sent to the DUT |

Table 1: Abbreviations and Notations

1.2 Terms

| Term | Description |
|----------------|--|
| Secure Element | A Secure Element (SE) is a tamper-resistant component which is used to provide the security, confidentiality, and multiple application environments required to support various business models For example UICC/SIM, embedded Secure Element, Secure SD card, |
| Applet | General term for Secure Element application: An application which is installed in the SE and runs within the SE. For example a JavaCard™ application or a native application |
| Application | Device/Terminal/Mobile application: An application which is installed in the mobile device and runs within the mobile device |

| Session | An open connection between an application on the device (e.g. mobile phone) and a SE. |
|-------------|---|
| Channel | An open connection between an application on the device (e.g. mobile phone) and an applet on the SE. |
| restarted | The DUT has been switched off completely and has been started again. No quick start, soft power off, or similar |
| same object | Two objects are the same object if the language-specific mechanism to check for identity of objects indicates that they are the same object. For example, for Java, the == operator should be used. |

Table 2: Terms

1.3 Format of the applicability table and table of optional features

The columns in table 4.2 for the optional features have the following meaning:

| Column | Meaning |
|---------------|--|
| Option | The optional feature supported or not by the DUT |
| Status | OP - optional feature |
| Optional item | The mnemonic identifiers for each optional item |

The columns in the applicability table 4.3 have the following meaning:

| Column | Meaning |
|--|---|
| Clause | Reference to the clause index in the document |
| Test case number and description | The test case description in the document |
| SUE | The support of the tested feature/method for the Simulated Environment has the following status: M mandatory - the capability is required to be supported. OP optional - the capability may be supported or not. In case the support is declared by terminal, the test shall be executed. N/A not applicable - in the given context, it is impossible to use the capability. |
| RSE | The support of the tested feature/method for the Real SE Environment has the following status: M mandatory - the capability is required to be supported. OP optional - the capability may be supported or not. In case the support is declared by terminal, the test shall be executed. N/A not applicable - in the given context, it is impossible to use the capability. |

Table 4: Informative References

Overview

This test specification describes how to test the Transport API part of the Open Mobile API. This is the mandatory part of the Open Mobile API. The other parts of the Open Mobile API shall be tested in a similar way.

This test specification is based on V2.05 of the Open Mobile API specification.

8

4. **Applicability**

4.1 Applicability of the tests

The test cases are categorized in the applicability table to use the test environment as follow:

- Simulated UICC environment (SUE): Test method shall be implemented in a simulated environment for the UICC.
- Real SE environment (RSE): Test method shall use a real SE environment. The test method shall use the one of type of SE according to implementation in the DUT and the applicability is stated in table as:
 - UICC: test cases executed with real UICC.
 - eSE: test cases executed with eSE.
 - mSD: test cases executed with mSD.

If both test methods are marked as applicable (SUE and RSE), only one of test methods is required for demonstrating device compliance. The test cases for Reader, Session and Channel should be executed for each reader supported by the DUT using the environment as defined above.

4.2 Table of DUT options

The DUT supplier shall specify the following information:

Supported Readers (number and type)

The DUT supplier shall state the support of possible options in table 4.1 for each SE.

Table 4.1: Options

| Ite | Option | Status | Optional item |
|-----|---|--------|---------------|
| m | | | |
| 1 | DUT offers possibility to log APDU communication to eSE or µSD | OP | OP-001 |
| 2 | access to the basic channel is blocked by the DUT | OP | OP-002 |
| 3 | access to the basic channel is allowed by the DUT | OP | OP-003 |
| 4 | the ATR returned by the SE is available | OP | OP-004 |
| 5 | the ATR returned by the SE is not available | OP | OP-005 |
| 6 | DUT supports T=0 communication with UICC | OP | OP-006 |
| 7 | DUT supports T=1 communication with UICC | OP | OP-007 |
| 8 | The selection response can be retrieved by the reader implementation | OP | OP-008 |
| 9 | The selection response cannot be retrieved by the reader implementation | OP | OP-009 |

4.3 Applicability table

The following table specifies the applicability of each test case to the mobile.

| Clause | Test case number and description | SUE | RSE | | |
|--------|---|--------|--------|--------------------------|--------------------------|
| | · | | UICC | eSE | mSD |
| | class SEService | | | | |
| 6.1.1 | Constructor: SEService(Context context, | М | М | M | М |
| | SEService.CallBack listener) | | | | |
| 6.1.2 | Method: Reader[] getReaders() | M | М | M | M |
| 6.1.3 | Method: boolean isConnected () | M | M | M | M |

| 6.5.7 | Method: Boolean[] selectNext() ID5 - ID6 | M | NA | NA | NA |

 $Securing\ the\ future\ of\ mobile\ services$

Table 5: Applicability of tests

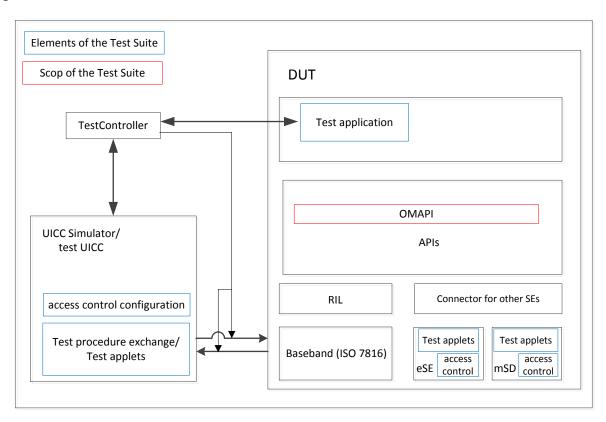

5_ Test environment

Securing the future of mobile services

This clause specifies requirements that shall be met and the testing rules that shall be followed during the test procedure.

5.1 **Test environment description**

The general architecture for the test environment is:

5.2 Test tool

5.2.1 **UICC Simulator**

The test equipment used for executing this test specification shall meet the following requirements in order to be able to use the OMAPI implementation on a mobile device:

- be able to send and receive the commands correctly on the lower layer; i.e. to use commands as specified in ISO/IEC 7816-4.
- be able to provide access to Basic and Logical Channels for APDUs transmission and channels can be opened simultaneously.
- the ATR used by the test equipment shall correctly show the minimum capability required to run the
- shall be capable to work in multi SEs environment.

- shall be able to provide the access control conditions according to section 5.8.
- for the implementation of the test procedure exchange/test Applets and the access control configuration, the main source of reference is this test specification

5.2.2 UICC, eSE and mSD

Unless otherwise specified, the following requirements and configuration shall be met:

- be able to send and receive the commands correctly on the lower layer; i.e. to use commands as specified in ISO/IEC 7816-4.
- be able to provide access to Basic and Logical Channels for APDUs transmission and channels can be opened simultaneously.
- the ATR send by the SE shall correctly show the minimum capability required to run the tests
- shall be capable to work in multi SEs environment.
- shall be able to provide the access control conditions according to section 5.8.
- all the test applets specified in section 5.7 need to be installed on the SE.
- only one NAA (network authentication application) installed to avoid that the mobile opens logical channels
- it shall be possible to verify APDU communication in a reliable way

5.2.3 Test controller

The following requirements shall be provided by the test controller:

- the APDU exchange must be made visible by the test tool when they are available. For example in case of UICC, or UICC simulator.
- the API commands must be made visible by the test tool.
- it must be able to provide the test setup prior to the execution of the test, i.e. install the related application on the mobile and do any further actions required to run the test.
- must be able to provide results of the tests
- should be able to automatically execute the tests

5.3 Test format

5.3.1 Conformance requirements

The conformance requirements are expressed in the following way:

- Method prototype as listed in Open Mobile API specification.
- Normal execution:
 - Contains normal execution and correct parameters limit values, each referenced as a Conformance Requirement Normal (CRN).
- Parameters error:
 - Contains parameter errors and incorrect parameter limit values, each referenced as a Conformance Requirement Parameter Error (CRP).

Context error:

 Contains errors due to the context the method is used in, each referenced as a Conformance Requirement Context Error (CRC).

5.3.2 Initial conditions

In addition to the general preconditions defined in clause 5.4, this clause defines the initial conditions prior to the execution of each test case; i.e. for each ID.

5.3.3 Test procedure

Each test procedure contains a table of a number of test cases, each of these tests specified as follows:

| | Test case | | | | | | | |
|--------|------------------------|-----------------------------|-----------------------|-------------------------|-----------------|--|--|--|
| ID | API Description | API Description ISO Command | | API Expectation | CRR | | | |
| | | Expectation DUT → | UICC Simulator / SE | | | | | |
| | | UICC Simulator / SE | → DUT | | | | | |
| The ID | The name of the | The expected ISO | The ISO response (R- | The expected result of | The list of the | | | |
| of the | OMAPI method | command (C-APDU) | APDU) sent by UICC | the OMAPI method | Conformity | | | |
| Test | called by the test | received by the UICC | Simulator / SE to the | called. E.g.: 'true' is | Requirements | | | |
| case | application. | Simulator / SE. It is sent | DUT as a response to | returned. | which is the | | | |
| | | by the DUT to UICC | the received ISO | | scope of the | | | |
| | | Simulator / SE as a result | command. | | Test case. | | | |
| | | of the OMAPI method | | | | | | |
| | | call. | | | | | | |

General notes regarding the ISO Command Expectation and ISO Response columns:

- Test cases are testing the implementation of the SIMalliance Open Mobile API implementation and not the behavior of the Secure Elements. However to make sure the API is correctly implemented by the device test cases are verifying command/response exchanges between the device and the SE/UICC Simulator.
- The ISO Command Expectation is checked to validate, if the OMAPI implementation sends the expected commands to the SE/UICC Simulator.
- The ISO Response is checked to validate that the API Expectation is fulfilled due to the expected R-APDU.
- The test procedure description contains APDU-s. The TPDU-s are not in the scope of the test specification so they are not listed in the test procedure descriptions.
- The APDU-s exchanged during the access control procedure are out of scope of the test procedure description and shall be not considered as ISO command expectation or ISO response.
- In case of T=0 protocol the case 2 type APDU-s sent to the SE/UICC Simulator with wrong length are resent with correct length. The test procedure description only contains the APDU-s sent first (with wrong length) and does not contain the APDU-s resent with correct length.

5.4 General Initial conditions

The General Initial Conditions are a set of general prerequisites prior to the execution of testing. The following rules apply:

- DUT shall be restarted for each test case and shall be ready for test execution.
- The test application is installed on the DUT.
- The test applets are installed on the SE

 No logical channels must be open before execution of the test cases if not explicitly mentioned in the initial condition of the test case

5.5 Mobile application and test controller

Unless otherwise specified, the test application shall be installed on the DUT.

The mobile application and the test controller are expected to be provided by test tool vendors.

SIMalliance provides a simple test runner as Android application. This application can execute the test cases and log results on the mobile. This test runner is not meant for compliance testing. It is provided as binary (APK) on SIMalliance web page.

5.6 Testcase implementation

Securing the future of mobile services

SIMalliance provides an implementation of the test cases in XML format. These test cases will be used by the SIMalliance test runner application and can be used by test tool manufacturers as a reference for certification. The test tool vendors are not required to use these XML files.

The XML files will be available on SIMalliance web page.

5.7 Secure Element Test applets

Unless otherwise specified, the required test applets shall be installed on the SE simultaneously. A reference of these test applets will be available on SIMalliance web page (binary files) for download.

Table 6. Used AIDs

5.7.1 Test APDU Interface

This table gives the list of commands that are used in test cases and that are supported by the Secure Element Test applets.

The values for "Cla" are depending on the test case: in most of the test cases the Cla contains a logical channel number

| | Cla | Ins | P1 | P2 | Lc | Data | Le |
|------------|-----|--------------------------|--|----|--------|------|----|
| Test_APDU1 | 0x | 10 (case 4) | 01 (for echo of the payload) | 00 | length | Data | 00 |
| Test_APDU2 | 0x | 10 (case | 02 (echo of the payload with long delay (more than 1 sec) before return) | 00 | length | Data | 00 |
| Test_APDU3 | 0x | 20 (filtered APDU) | 00 | 00 | length | Data | 00 |
| Test_APDU4 | 0x | 30 (case 1) | 00 | 00 | | | |
| Test_APDU5 | 0x | 40 (case 2) | 00 | 00 | | | 00 |
| Test_APDU6 | 0x | 50 (case | 00 | 00 | length | Data | |

| | | 3) | | | | | |
|----------------------|-------|--|--|----|----|------|----|
| Test_APDU7 | 0x | 55 case1 | 00 (waiting time extension has to be send) | 00 | | | |
| APDU_case1 | 0x | 01 | 01-32 | 00 | | | |
| APDU_case2 | 0x | 02 | 01-11 | 00 | | | FF |

Table 8: P1 - Status word pairs

The length of the data and the data bytes may be adapted by the test controller for different test runs (e.g. run the test cases with different data length during different test runs). The test applet must be able to handle different data length.

5.8 Access Control Configuration

To test security errors two rules shall be defined complying with GP SEAC

- Rule 1: It denies access to AID_accessdenied from any mobile application
- Rule 2: denies sending a specific APDU command: Test_APDU3 to AID_TestApp from any mobile application

For all other tests, a rule granting access to all Applets for all mobile applications shall be used. An example of ARA applet and ARF configuration is provided in Annex

6. Test Cases

6.1 Class SEService

The SEService realizes the communication to available Secure Elements on the device.

This is the entry point of this API. It is used to connect to the infrastructure and get access to a list of Secure Element Readers.

6.1.1 Constructor: SEService(Context context, SEService.CallBack listener)

(a) Conformance Requirements

The constructor with the following header shall be compliant to its definition in the API.

SEService (Context context, SEService.CallBack listener)

Normal execution

CRN1: Establishes a new connection that can be used to connect to all the Secure Elements available in the

CRN2: The isConnected() method returns true after the connection process is finished.

CRN3: The serviceConnected() method of the listener object is called.

Parameter errors

CRP1: IllegalParameterError – if the parameter "context" is null.

Context errors

None

(b) Initial Conditions

6.1.2 Method: Reader[] getReaders()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

Reader[] getReaders()

Normal execution

CRN1: Reader[] contains the list of available secure element readers.

CRN2: If there is no reader, then the array of readers returned by getReaders() method has length 0

CRN3: There must be no duplicated objects in the list of readers

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

(c) Test Procedure

| | Test case | | | | | | | | |
|----|-------------------------|---------------------------|---------------------------------|--|--------------|--|--|--|--|
| ID | API Description | ISO Command Expectation | ISO Response | API Expectation | CRR | | | | |

| 1 | | SEService GetReaders | with return of multiple readers | | | | | | |
| | seService.getReaders () | None | None | Returned array contains list with the correct number of the supported readers; There must be no duplicated entries in the list | CRN1 CRN3 | | | | |

6.1.3 Method: boolean isConnected ()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

boolean isConnected ()

Normal execution

CRN1: isConnected() returns true if the service is connected CRN2: isConnected() returns false if the service is not connected

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

(c) Test Procedure

| | Test case | | | | | | | |
|----|----------------------|---------------------------|---------------------------|---------------|------|--|--|--|

| | 2. | | | 2. | | | | |
| | seService.isConnecte | | | Returns false | | | | |
| | d() | | | | | | | |

6.1.4 Method: void shutdown ()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

Void shutdown ()

Normal execution

CRN1: Releases all Secure Elements resources allocated by this SEService.

CRN2: As a result isConnected() will return false after shutdown() was called.

CRN3: After this method call, the state of SEService object is invalid (not connected any more).

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

| | Test case | | | | | | | |

6.1.5 Method: void getVersion()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

String getVersion()

Normal execution

CRN1: Returns the version of the OpenMobile API specification this implementation is based on.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

(c) Test Procedure

| | Test case | | | | | | | |
|----|--------------------------|---------------------------|---------------------------|--|------|--|--|--|
| ID | API Description | ISO Command Expectation | ISO Response | API Expectation | CRR | | | |
| | | DUT → UICC Simulator / SE | UICC Simulator / SE → DUT | | | | | |
| 1 | | getVersion retu | rns version string | | | | | |
| | 1. seService.getVersion(| none | none | 1. returns a String that contains the OpenMobile API version (e.g. 2.05) | CRN1 | | | |

6.2 Class (or interface): SEService.CallBack

Interface to receive call-backs when the service is connected.

If the target language and environment allows it, then this shall be an inner interface of the SEService class.

6.2.1 Method: void serviceConnected(SEService service)

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

void serviceConnected(SEService service)

Normal execution

CRN1: The SEService object parameter must be the object that was created as result of the SEService constructor and must not be null.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Constructor called

(c) Test Procedure

| | Test case | | | | | | | | |
|----|---|---------------------------|------------------------------|---|------|--|--|--|--|
| ID | API Description | ISO Command Expectation | ISO Response | API Expectation | CRR | | | | |
| | | DUT → UICC Simulator / SE | UICC Simulator / SE → DUT | | | | | | |
| 1 | | SEService Callback | k received after constructor | | | | | | |
| | 1. serviceConnected(SE Service service) received; 2. Call seService.isConnecte d() of received SEService object | none | none | 1. SEService object created with constructor and the one received in the callback are the same object 2. seService .isConnected returns true. | CRN1 | | | | |

6.3 Class Reader

The instances of this class represent Secure Element Readers connected to this device. These Readers can be physical devices or virtual devices. They can be removable or not. They can contain one Secure Element that can or cannot be removed.

6.3.1 Method: String getName()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

String getName()

Normal execution

CRN1: Return the name of this reader.

- If this reader is a SIM reader, then its name must be "SIM[Slot]"
- If the reader is a SD or micro SD reader, then its name must be "SD[slot]"
- If the reader is a embedded SE reader, then its name must be "eSE[slot]"

Slot is a decimal number without leading zeros. The Numbering must start with 1 (e.g. SIM1, SIM2, ... or SD1, SD2, ... or eSE1, eSE2, ...). The slot number "1" for a reader is optional (SIM and SIM1 are both valid for the first SIM-reader, but if there are two readers then the second reader must be named SIM2). This applies also for other SD or SE readers.

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

The "reader" instance is an element of a Reader[] array, returned by invoking seService.getReaders() method.

(c) Test Procedure

| | Test case | | | | | | | |
|----|------------------|---------------------------|---------------------------|---|------|--|--|--|
| ID | API Description | ISO Command Expectation | ISO Response | API Expectation | CRR | | | |
| | | DUT → UICC Simulator / SE | UICC Simulator / SE → DUT | | | | | |
| 1 | | (| Get Name | | | | | |
| | reader.getName() | none | none | Returned String is not null and returns the correct string. E.g.: "SIM1 or SIM" for the first SIM reader. No exception is expected. | CRN1 | | | |

6.3.2 Method: SEService getSEService()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

SEService getSEService()

Normal execution

CRN1: Get the SEService that provides this Reader

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. The "reader" instance is an element of a Reader[] array, returned by invoking seService.getReaders() method.

| | Test case | | | | | | | |
|----|----------------------------------|---------------------------|-------------------------|---|------|--|--|--|
| ID | API Description | ISO Command Expectation | ISO Response | API Expectation | CRR | | | |

| | | object which provides this Reader.) | |
|--|--|-------------------------------------|--|
| | | • | |

6.3.3 Method: boolean isSecureElementPresent()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

boolean isSecureElementPresent()

Normal execution

CRN1: this method checks if a Secure Element is present in the reader, in case of its presence it returns true CRN2: this method returns false if the Secure Element is not present in the reader.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. The "reader" instance is an element of a Reader[] array, returned by invoking seService.getReaders() method.

Test case ID 1: The SE used for testing is available and accessible

Test case ID 2: The SE that is tested is not inserted

(c) Test Procedure

| | | Tes | st case | | |
|----|-------------------------------------|--------------------------|---------------------------|---|------|
| ID | API Description | ISO Command Expectation | ISO Response | API Expectation | CRR |
| | | DUT →UICC Simulator / SE | UICC Simulator / SE → DUT | | |
| 1 | | Secure E | Element is present | | |
| | reader.isSecureEle mentPresent() | None | None | True is returned No exception is expected. | CRN1 |
| 2 | | Secure Ele | ement is not present | 1 | · I |
| | reader.isSecureEle mentPresent() | None | None | False is returned No exception is expected. | CRN2 |

6.3.4 Method: Session openSession()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

Session openSession()

Normal execution

CRN1: this method allows an application to connect to a secure element in the reader

CRN2: the Secure Element needs to be prepared (initialized) for communication (i.e. switched on)

CRN3: There might be multiple sessions opened at the same time on the same reader.

CRN4: this method returns a Session object to be used to create Channels.

Parameter errors

None

Context errors

CRC1: IOError - something went wrong with the communication to the secure element.

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. The "reader" instance is an element of a Reader[] array, returned by invoking seService.getReaders() method.

Test case ID 1: A SE is connected to the Reader. No opened Sessions.

Test case ID 2: A SE is connected to the Reader.

| | | Te | st case | | |
|----|--|--|--|---|------------------------------|
| ID | API Description | ISO Command Expectation DUT →UICC Simulator / SE | ISO Response UICC Simulator / SE → DUT | API Expectation | CRR |

| | 2. Session s2 = reader.openSession (); | | | 2. No exception is expected. | |
| | 3. s1 != s2; | | | 3.Session instances s1 and s2 are not | |
| | | | | the same. No exception is expected. | |

6.3.5 Method: void closeSessions()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

void closeSessions()

Normal execution

CRN1: This method closes all the sessions opened on this reader CRN2: All the channels opened by all this session will be closed.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. The "reader" instance is an element of a Reader[] array, returned by invoking seService.getReaders() method.

Test case ID 1: A SE is connected to the Reader. Session instances s1 and s2 are created.

Test case ID 2: A SE is connected to the Reader. Session instance s1 is created. Three logical channels are opened within 's1'.

| | | Tes | st case | | |

| | | CHANNEL (P1='80') | RESP 1-3: R-APDU - SW '90 00' | | |

6.4 Class Session

6.4.1 Method: Reader getReader()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

Reader getReader()

Normal execution

CRN1: Get the reader that provides this session.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

| | | Tes | st case | | |
|----|---------------------------------|--|---|---|------|
| ID | API Description | ISO Command Expectation DUT -> UICC Simulator / SE | ISO Response UICC Simulator / SE -> DUT | API Expectation | CRR |
| 1 | | Return the Reader of | bject for a Session instance | | |
| | session.getReader() | None. | None. | Returned Reader object is not null. No exception is expected. | CRN1 |
| 2 | Ge | t the Reader object and compar | e with the object that provides | his session | |
| | session.getReader() ==reader | None. | None. | The Reader object returned by getReader() is the same object as the one which provides this session. No exception is expected. | CRN1 |

6.4.2 Method: byte[] getATR()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

byte[] getATR()

Normal execution

CRN1: this method gets the Answer to Reset of this secure element.

CRN2: if the ATR for this secure element is not available the returned byte array is null

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

Test case ID1 and ID2: The UICC Simulator / SE has sent its "ATR" to the DUT.

| | | Tes | st case | | |
|----|----------------------------|--|---|---|------|
| ID | API Description | ISO Command Expectation DUT -> UICC Simulator / SE | ISO Response UICC Simulator / SE -> DUT | API Expectation | CRR |
| 1 | | Return the | e Answer To Reset | | |
| | session.getATR(); | None | None | No exception is expected. | CRN1 |
| 2 | | Returned Answer To Reset 6 | equals to the "ATR" sent during | reset | |
| | session.getATR()== ATR; | None | None | The Answer to Reset returned by getATR() equals to the "ATR" sent by the UICC Simulator / SE. No exception is expected. | CRN1 |
| 3 | | Return null in case the | Answer To Reset is not available | e | |
| | session.getATR(); | None | None | Null is expected to return. No exception is expected. | CRN2 |

6.4.3 Method: void close()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

void close()

Normal execution

CRN1: Close the connection with the secure element.

CRN2: This API will close any channels opened by this application with this secure element.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

A Reader instance "reader" is selected and a Session instance "session" is opened with the selected

"reader"

Test case ID 1: One logical channel is opened to AID_TestApp.

Test case ID 2: Three logical channels are opened to AID_TestApp_multiselectable

| Test case | | | | | | | | |
|-----------|--|--|---|---------------------------|------|--|--|--|
| ID | API Description | ISO Command Expectation DUT -> UICC Simulator / SE | ISO Response UICC Simulator / SE -> DUT | API Expectation | CRR | | | |

| | | CMD 1-3: MANAGE CHANNEL (P1='80') | RESP 1-3: R-APDU - SW '90 00' | | | | | |

6.4.4 Method: boolean isClosed()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

boolean isClosed()

Normal execution

CRN1: Tells if this session is closed: if so, isClosed returns "true"

CRN2: If the session is open it returns false

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

| Test case | | | | | | | | |

| 2 | Check an open session | | | | | | | |
| | session.isClosed(); | None | None | "false" is expected to return. No exception is expected. | CRN2 | | | |

6.4.5 Method: void closeChannels()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

void closeChannels()

Normal execution

CRN1: Close any channel opened on this session.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

Test case ID1: Three logical channels are opened to AID_TestApp_multiselectable.

Test case ID2: No logical channel is opened.

(c) Test Procedure

| Test case | | | | | | | | |
|-----------|------------------------------------|--|---|---------------------------|------|--|--|--|
| ID | API Description | ISO Command Expectation DUT -> UICC Simulator / SE | ISO Response UICC Simulator / SE -> DUT | API Expectation | CRR | | | |
| 1 | | Close all the channels opened by the session | | | | | | |
| | 1. session.closeChann els(); | CMD 1-1: MANAGE CHANNEL (P1='80') | RESP 1-1: R-APDU - SW '90 00' | No exception is expected. | CRN1 | | | |
| | | CMD 1-2: MANAGE CHANNEL (P1='80') | RESP 1-2: R-APDU - SW '90 00' | | | | | |
| | | CMD 1-3: MANAGE CHANNEL (P1='80') | RESP 1-3: R-APDU - SW '90 00' | | | | | |
| 2 | | Close if no channel is open | | | | | | |
| | 1. session.closeChann els(); | None | None | No exception is expected. | CRN1 | | | |

6.4.6 Method: Channel openBasicChannel(byte[] aid)

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

Channel openBasicChannel(byte[] aid)

Normal execution

CRN1: Get an access to the basic channel, as defined in the ISO7816-4 specification (the one that has number 0). The obtained object is an instance of the Channel class.

CRN2: The AID can be null, which means no SE application is to be selected on this channel and the default SE application is used. If the default SE application is not currently selected on the basic channel then null will be returned.

CRN3: Once this channel has been opened by a device application, it is considered as "locked" by this device application, and other calls to this method will return null, until the channel is closed.

CRN4: Returns null, if the basic channel is locked (e.g. by the Secure Element drivers).

Parameter errors

CRP1: IllegalParameterError - if the aid's length is not within 5 to 16 (inclusive).

Context errors

CRC1: IOError - if something goes wrong with the communication to the reader or the secure element.

CRC2: NoSuchElementError – If the AID on the Secure Element is not available

CRC3: IllegalStateError - if the secure element session is used after being closed.

CRC4: SecurityError - if the calling application cannot be granted access to this AID on this session.

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

6.4.7 Method: Channel openLogicalChannel(byte[] aid)

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

Channel openLogicalChannel(byte[] aid)

Normal execution

CRN1: Open a logical channel with the secure element, selecting the application represented by the given

CRN2: if the AID is null, then the default application shall be used.

CRN3: It's up to the secure element to choose which logical channel will be used.

CRN4: return null if secure element is unable to provide a new logical channel

CRN5: if the selection of the SE applet fails the logical channel shall be closed

CRN6: If the status word indicates that the Secure Element was able to open a channel (e.g. status word '90 00' or status words referencing a warning in ISO-7816-4: '62 XX" or "63 XX') the API shall keep the channel opened

Parameter errors

CRP1: IllegalParameterError - if the aid's length is not within 5 to 16 (inclusive).

Context errors

CRC1: IOError - if something goes wrong with the communication to the reader or the secure element. (e.g. Secure Element is no more available)

CRC2: NoSuchElementError - if the AID on the Secure Element is not available (or cannot be selected) or a logical channel is already open to a non-multiselectable Applet.

CRC3: IllegalStateError - if the secure element session is used after being closed.

CRC4: SecurityError - if the calling application cannot be granted access to this AID on this session.

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

Test case ID 5: The maximum number of logical channels supported by the UICC Simulator / SE is already opened to AID_TestApp_multiselectable.

6.5 Class: Channel

Instances of this class represent an ISO7816-4 channel opened to a secure element. It can be either a logical channel or the default channel.

They can be used to send APDUs to the secure element. The "channel" instances are opened by calling the Session.openBasicChannel(byte[]) or Session.openLogicalChannel(byte[]) methods.

6.5.1 Method: void close()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API. void close()

Normal execution

CRN1: the close() method closes the channel to the Secure Element

CRN2: if the channel is the basic channel, then it becomes available again

CRN3: if the channel is already closed, the method is ignored

CRN4: The close() method shall wait for completion of any pending transmit(byte[] command) before closing the channel.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

Test cases ID1,ID3,ID4: a logical channel with "AID_TestApp" is already open.

Test case ID2: a basic channel with "AID_TestApp" is already open.

6.5.2 Method: boolean isBasicChannel()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

boolean isBasicChannel()

Normal execution

CRN1: this method returns true if the channel is the basic channel CRN2: this method returns false if the channel is a logical channel

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

Test case ID1: a basic channel with "AID_TestApp" is already open. Test case ID2: a logical channel with "AID_TestApp" is already open.

| | Channel.isBasicCha nnel(); | | | | | |

6.5.3 Method: boolean isClosed()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

boolean isClosed ()

Normal execution

CRN1: this method returns true if the channel is closed CRN2: this method returns false if the channel is open

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

For all test cases: a logical channel with "AID_TestApp" is already open.

6.5.4 Method: byte[] getSelectResponse()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

byte[] getSelectResponse()

Normal execution

CRN1: Returns the data as received from the application select command inclusively the status word.

CRN2: The returned byte array contains the data bytes in the following order:

[<first data byte>, ..., <last data byte>, <sw1>, <sw2>]

CRN3: The returned byte array contains only the status word if the application select command has no data returned.

CRN4: Null is returned if the application select command has not been performed.

CRN5: Null is returned if the selection response cannot be retrieved by the reader implementation.

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

Test case ID1: a logical channel with "AID_TestApp_selectresponse" is already open.

Test cases ID2: a logical channel with "AID_TestApp" is already open.

Test case ID3: a logical channel with "null" AID is already open.

Test case ID 4: a logical channel with "AID_TestApp_SW6283_selectresponse" is already open

6.5.5 Method: Session getSession()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API. Session getSession()

Normal execution

CRN1: this method returns the session object this channel is bound to

Parameter errors

None

Context errors

None

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

A logical channel with "AID_TestApp" is already open.

(c) Test Procedure

| | | Те | st case | | |

| ID | API Description | ISO Command | UICC Simulator - ISO | API Expectation | CRR |
| | | Expectation | Response | | |
| | | DUT → UICC Simulator/SE | | | |
| | | | UICC Simulator/SE → DUT | | |
| 1 | | Return the Session | object for a Channel instance | | |
| | 1. Session == Channel.getSession () | CMD 1-1: None | RESP 1-1: None | 1. The Session object returned by getSession() is not null and is the same object created in initial conditions. | CRN1, |

6.5.6 Method: byte[] transmit(byte[] command)

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

byte[] transmit(byte[] command)

Normal execution

CRN1: Transmit an APDU command as per ISO7816-4 to the secure element. The underlying layers can generate as many TPDUs as necessary to transport this APDU. The transport part is invisible from the application.

CRN2: The system ensures the synchronization between all the concurrent calls to this method. The entire APDU communication to this SE is locked to the APDU.

CRN3: The system ensures that only one APDU will be sent at a time, irrespective of the number of TPDUs that might be required to transport it to the SE.

CRN4: The channel information in the class byte in the APDU will be ignored: the system will add any required information to ensure the APDU is transported on this channel.

CRN5: Waiting time extension is handled in correct way

CRN6: T=0/T=1 transport protocol related responses are handled inside the API or underlying implementation

Parameter errors

CRP1: IllegalParameterError – if the command parameter is null.

CRP2: IllegalParameterError – if a MANAGE_CHANNEL command is supplied as a command parameter

CRP3: IllegalParameterError – if a SELECT by DF Name (p1=04) command is supplied as a command parameter

CRP4: IllegalParameterError – if the command parameter is less than 4 bytes long

Context errors

CRC1: IOError - if there is a communication problem to the reader or the Secure Element.

CRC2: IllegalStateError - if the channel is closed at the time of invocation of this method

CRC3: SecurityError - if the command parameter is filtered by the security policy.

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true.

A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

Test case ID1: a basic channel with "AID_TestApp" is already open.

Test cases ID2, ID5 to ID14 and ID16, ID20: a logical channel with "AID_TestApp" is already open.

Test cases ID3: a logical channel with "AID_TestApp" is already open. SE shall return logical channel number 1.

Test case ID 4: Three channels are created in three different sessions

Test case ID 15: The two channels are created in two different sessions, each one created in a different

SEService. (e.g. channel1 created by session1 created by seService1 created in thread1)

Test case ID 17: a logical channel with "AID_TestApp_p1p2" is already open.

Test case ID 18: a logical channel with "AID_TestApp_clains" is already open.

Test case ID 13: UICC Simulator/UICC must only support T=0

Test case ID 14: UICC Simulator/UICC must only support T=1

Test case ID 21: a logical channel with "AID_TestApp_SW61xx" is already open.

6.5.7 Method: boolean[] selectNext()

(a) Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

boolean selectNext()

Normal execution

CRN1: Performs a selection of the next Applet on this channel that matches to the partial AID specified in the openBasicChannel(byte[] aid) or openLogicalChannel(byte[] aid) method. This mechanism can be used by a device application to iterate through all Applets matching to the same partial AID. If selectNext() returns true a new Applet was successfully selected on this channel.

CRN2: The implementation of the underlying SELECT command within this method shall use the same values as the corresponding openBasicChannel(byte[] aid) or openLogicalChannel(byte[] aid) command with the option: P2='02' (Next occurrence)

CRN3: If no further Applet exists with matches to the partial AID this method returns false and the already selected Applet stays selected.

CRN4: The select response stored in the Channel object shall be updated with the APDU response of the SELECT command.

Context errors

CRC1: IOError - if there is a communication problem to the reader or the Secure Element.

CRC2: OperationNotSupportedError - if this operation is not supported by the card.

CRC3: IllegalStateError - if the Secure Element is used after being closed.

(b) Initial Conditions

SEService Object has been created and the isConnected() method has been called and has returned true. A Reader instance "reader" is selected and a Session instance "session" is opened with the selected "reader".

Test cases ID1,ID3,ID5,ID6,ID7: a logical channel with "AID_Partial_1_instance_1" is already open by selecting "AID_Partial_1".

Test cases ID2,ID4: a logical channel with "AID_Partial_2" is already open.

Test cases ID8: a logical channel with "AID_Partial_SW6280" is already open.

Test cases ID9: a logical channel with "AID_Partial SW6283" is already open.

7. History

| Version | Date | Author | Comment | |
|---------|------------|-------------|--|--|
| 0.9 | 13.09.2013 | SIMalliance | Initial Release 0.9 | |
| 1.0 | 29.01.2014 | SIMalliance | first release after public review; several test cases add or existing modified | |

Table 9: History

Annex A: (normative): None tested requirements

The requirements that are not tested in the current version of the specification listed in table A.1. The section index referenced in table A.1 is the index used in this specification.

Table A.1

| Requirement | Class | Index | Method |
|---|-----------|-------|--------------------------|
| CRC1: IOError - something went wrong with the | Reader | 6.3.4 | Session |
| communication to the secure element. (e.g. no SE | | | openSession() |
| connected or no more Session available) | | | |
| CRN1: This method closes all the sessions opened on this reader | Reader | 6.3.5 | void closeSessions() |
| CRN2: the Secure Element needs to be prepared (initialized) for communication (i.e. switched on) | Reader | 6.3.4 | Session openSession() |
| CRN2: If there is no reader, then the array of readers returned by getReaders() method has length 0 | SEService | 6.1.2 | Reader[] getReaders() |

Annex B: Access Control Configuration Examples

Access Control Applet (ARA)

A simple ARA applet provides the access rules to the Enforcer application in the mobile. This will be provided on SIMalliance web page. According to this access rules, the Enforcer will decide whether allowing the access to any applet instance or not (see GPSEAC specification).

The ARA-M Applet from this test spec may provide to the Enforcer either all the existing access rules (GET DATA all command) or only the specific rules of an Applet (GET DATA specific command).

- Rule 1 implementation: The GET DATA (specific) for getting the rule related to the denied Applet is:

```
CLA \rightarrow 80
INS \rightarrow CA
P1 P2 \rightarrow FF 50 (GET DATA specific)
Lc \rightarrow XX
REF-DO \rightarrow E1 (tag) XX (length)
AID-REF-DO \rightarrow4F (tag) XX (length)
XX XX XX (Denied Applet AID)
Hash-REF-DO \rightarrow C1 (tag) 00 (length)
Le \rightarrow 00
```

The response contains the access rule which does not allow sending any APDU to the denied Applet from any mobile application:

```
Response AR-DO → FF 50 08
           AR-DO → E3 (tag) 06 (length)
              APDU-AR-DO → D0 (tag) 01 (length) 00 (Never: APDU access is not allowed)
              NFC-AR-DO → D1(tag) 01 (length) 00 (Never: NFC event access is not allowed)
```

- Rule 2 implementation: GPSEAC forces to define access rules only for allowed APDUs per Applet. Therefore it is required to allow all APDUs used for 'AID_TestApp' Applet test cases, it means, all the APDUs listed in the OMAPI test spec with the exception of 'Test_APDU3' command:

Then, the set of masks and respective expected results for allowing Test_APDUx are as follows:

| Incoming APDU | Mask | Expected result |
|---------------------------|-------------|-----------------|
| Test_APDU1 | FE FF FF FF | 00 10 01 00 |
| Test_APDU2 (CLA = 00, 01) | FE FF FF FF | 00 10 02 00 |
| Test_APDU2 (CLA = 02) | FF FF FF FF | 02 10 02 00 |
| Test_APDU4 | FE FF FF FF | 00 30 00 00 |
| Test_APDU5 and Test_APDU6 | FE EF FF FF | 00 40 00 00 |

ARA Applet sends all masks and expected results when the Enforcer requests it through a GET DATA (specific) for 'AID_TestApp' Applet.

```
CLA → 80
INS → CA
P1 P2 → FF 50 (GET DATA specific)
Lc \rightarrow XX
REF-DO → E1 (tag) XX (length)
       AID-REF-DO →4F (tag) XX (length)
                       XX XX XX (AID_TestApp_apdu_filtered)
       Hash-REF-DO → C1 (tag) 00 (length)
Le \rightarrow 00
```

The response of the ARA Applet encapsulates the masks and expected results:

```
Response AR-DO → FF 50 2F
     AR-DO → E3(tag) 2D (length)
        APDU-AR-DO → D0 (tag) 28 (length)
               00 10 01 00 FE FF FF FF 00 10 02 00 FE FF FF FF 02 10 02 00 FF FF FF FF
               00 30 00 00 FE FF FF FF 00 40 00 00 FE EF FF FF
```

Access Control file system (ARF)

64

Additionally a PKCS#15 file structure is provided with the access rules. Here it is described following PKCS#15 examples in GPSEAC specification (see also PKCS#15 v1.1 spec):

PKCS#15 file system

```
MF (3F00)
|- EF DIR (2F00) --> shall reference PKCS-15
